Methodology in Brief

This survey was funded by the South Kingstown Housing Authority, the Social Science Institute for Research, Education, and Policy, the Rhode Island Foundation, and the Johnny Cake Center. It is part of a larger project on public housing in South Kingstown, Rhode Island. The survey is one component of the larger project and was designed to measure public housing residents’ attitudes towards their housing.

The survey was designed by Dr. Skip Mark, PhD with URI masters student Emmanuel Michaca in consultation with the South Kingstown Housing Authority and Dr. Shanna Pearson-Merkowitz, PhD. The survey was administered by URI graduate and undergraduate students who underwent training in survey methodology with Dr. Skip Mark and completed the Collaborative Institutional Training Initiative (CITI) research ethics and Human Subjects training.

The instrument was generated in English and Spanish using Qualtrics. Respondents who completed the survey were given $20 gift cards to Stop and Shop, a local grocery chain. From July - August of 2021 the survey was administered in person using the Qualtrics offline survey product on tablets. During this time, students knocked on each door at Public Housing residences and asked residents to partake in the survey. Due to a rise in COVID-19, the survey methodology was changed in late August of 2021 to a drop-off-pick-up method. Survey administrators dropped-off survey packets on Thursday afternoons to every door at one or more housing developments; they returned the following Sunday to pick up completed surveys. Residences with completed surveys were then given the gift card.

South Kingstown's three public housing developments were surveyed repeatedly with surveyors returning four times to increase response rates. The final response rate for South Kingstown was 54%. Other locations were only visited once. The survey response rate at the other public housing locations was 40 - 50%. All survey locations were selected from the United States Department of Housing and Urban Development list of public housing developments in Rhode Island. We chose housing developments where residential units could be directly accessed, minimizing exposure of residents and surveyors to COVID-19. This meant that we had to exclude apartment buildings where resident doors were located within the building. Our team partnered with Housing Authorities in Bristol, Kent, Providence, Newport, and South Kingstown to inform residents of the survey. The response rate in areas outside of South Kingstown ranged from 40% to over 50%.

Likert scales were used to identify respondents’ attitudes. These have been provided in bar graphs below. For each question we generated graphs for Non-South Kingstown developments and South Kingstown developments for ease of comparison. We also generated three latent measures of housing satisfaction that combine responses to three items: satisfaction with the units themselves, satisfaction with management, satisfaction with the safety of the area, and satisfaction with the community. We generated latent satisfaction using an Item Response Theory rating scale model.
We combine all questions asking about satisfaction with the unit (Q14) into one measure (satisfaction with the units); all questions asking about satisfaction with management (Q15) into one measure and all questions asking about satisfaction with safety (Q10) into one measure. Numbers greater than zero indicate more positive attitudes while scores below zero indicate more negative attitudes. Using multiple regression, we examine how levels of satisfaction in South Kingstown compared to the rest of the state. We also test how resident age, white individuals compared to non-white individuals, resident gender, presence of children, access to a car, the reliability of car access, and disability status impacted individuals’ satisfaction levels. Each of these is measured as a dichotomous variable (satisfied (1) or not satisfied(0)). We plot these findings in a coefficient plot with confidence intervals. Where the coefficients fall entirely above or below zero, the indicator is considered statistically significant and individuals who fall under that category are significantly more or less satisfied compared to the comparison group while controlling for other factors. For example, these graphs show that while controlling for other factors, those 65 or older are significantly more likely to be satisfied with the community than those under 65.

The “South Kingstown” variable indicates whether individuals in public housing developments in South Kingstown are significantly more/less satisfied compared to public housing residents in Rhode Island outside South Kingstown when controlling for other factors such as age, race, having children, etc. The “White” variable indicates whether white individuals are significantly more/less satisfied compared to non-white individuals. The “Women” variable indicates whether women are more/less satisfied compared to men and “Child” indicates whether individuals in a household with at least one child are more/less satisfied compared to households without children. The variable “No Access to Car” indicates whether individuals without access to a car are more/less satisfied compared to those with access to a car. “Unreliable car” indicates whether individuals with an unreliable car (if they have access) are more/less satisfied compared to those with a reliable car. Finally, “Disabled” indicates how those with disabilities experience public housing compared to those without disabilities.

### Survey Questions

**Question 1**  
**Respondent County Location**

![](Q1. Location of Surveys)
Question 2  How many years have you been living in this apartment/housing unit?

Question 3  In your opinion, the cost of acquiring or renting this apartment/housing unit can best be described as...

Question 4  Which best describes your access to a car?
Question 5  How reliable is the car you have access to? (If applicable)

Question 6-1  How difficult is it for your household to access the following: Public Transportation

Question 6-2  How difficult is it for your household to access the following: Recreational Areas
Question 6-3  How difficult is it for your household to access the following: Grocery Stores
