

2024 Bacteria Data - Salt Pond Sites: Fecal coliform and enterococci

Fecal coliform and enterococci bacteria are monitored to indicate the presence of human sewage and associated pathogens, or disease causing organisms. The Department of Health (RIHealth) uses a single-sample value enterococci standard for licensed swimming beaches. The RI Department of Environmental Management (RIDEM) uses a geometric mean approach for contact recreation (i.e. swimming) standards on all other waters (fresh and salt). For the National Shellfish Sanitation Program, RIDEM also assesses fecal coliform levels for shellfish waters and their tributaries (not to exceed 14 fecal coliform per 100 mL). While URIWW's analytical laboratories are certified by the State, URIWW bacteria data are intended for screening purposes only. Our data help target areas of concerns and track potential sources of bacterial contamination. Starting in 2020, the Salt Pond Coalition tests bacteria every two weeks at select sites to get a better handle on conditions after periods of high bacteria levels in 2019. Any result above the state standard is considered unsafe, and swimmers should refrain from swimming until results return to acceptable levels, or for at least several days after heavy rain. Check out our bacteria factsheet at <http://cels.uri.edu/docslink/ww/water-quality-factsheets/Bacteria.pdf> to learn more about how bacteria are monitored, where they come from, what bacterial indicators are, and how we can all help to reduce bacterial input into our local water resources.

Salt Pond Coalition Sites 2024 Fecal Coliform Data

Monitoring Location	5/22	6/5	6/19	7/3	7/17	7/31	8/14	8/28	9/11	9/25	10/9	GeoMean
	----- Most Probable Number of Fecal coliform per 100 mL -----

RI Department of Environmental Management Enterococci Standards:

Non-designated Bathing Beach (Fresh) Waters Geometric Mean Density - Not to exceed 54 enterococci per 100 mL.

Designated Bathing Beach (Fresh) Waters Geometric Mean Density - Not to exceed 33 enterococci per 100 mL.

Marine Waters Geometric Mean Density - Not to exceed 35 enterococci per 100 mL.
