Amara's Law

We tend to overestimate the effect of a technology in the short run and underestimate the effect in the long run.

Amara's Law

We tend to overestimate the effect of a technology in the short run and underestimate the effect in the long run.

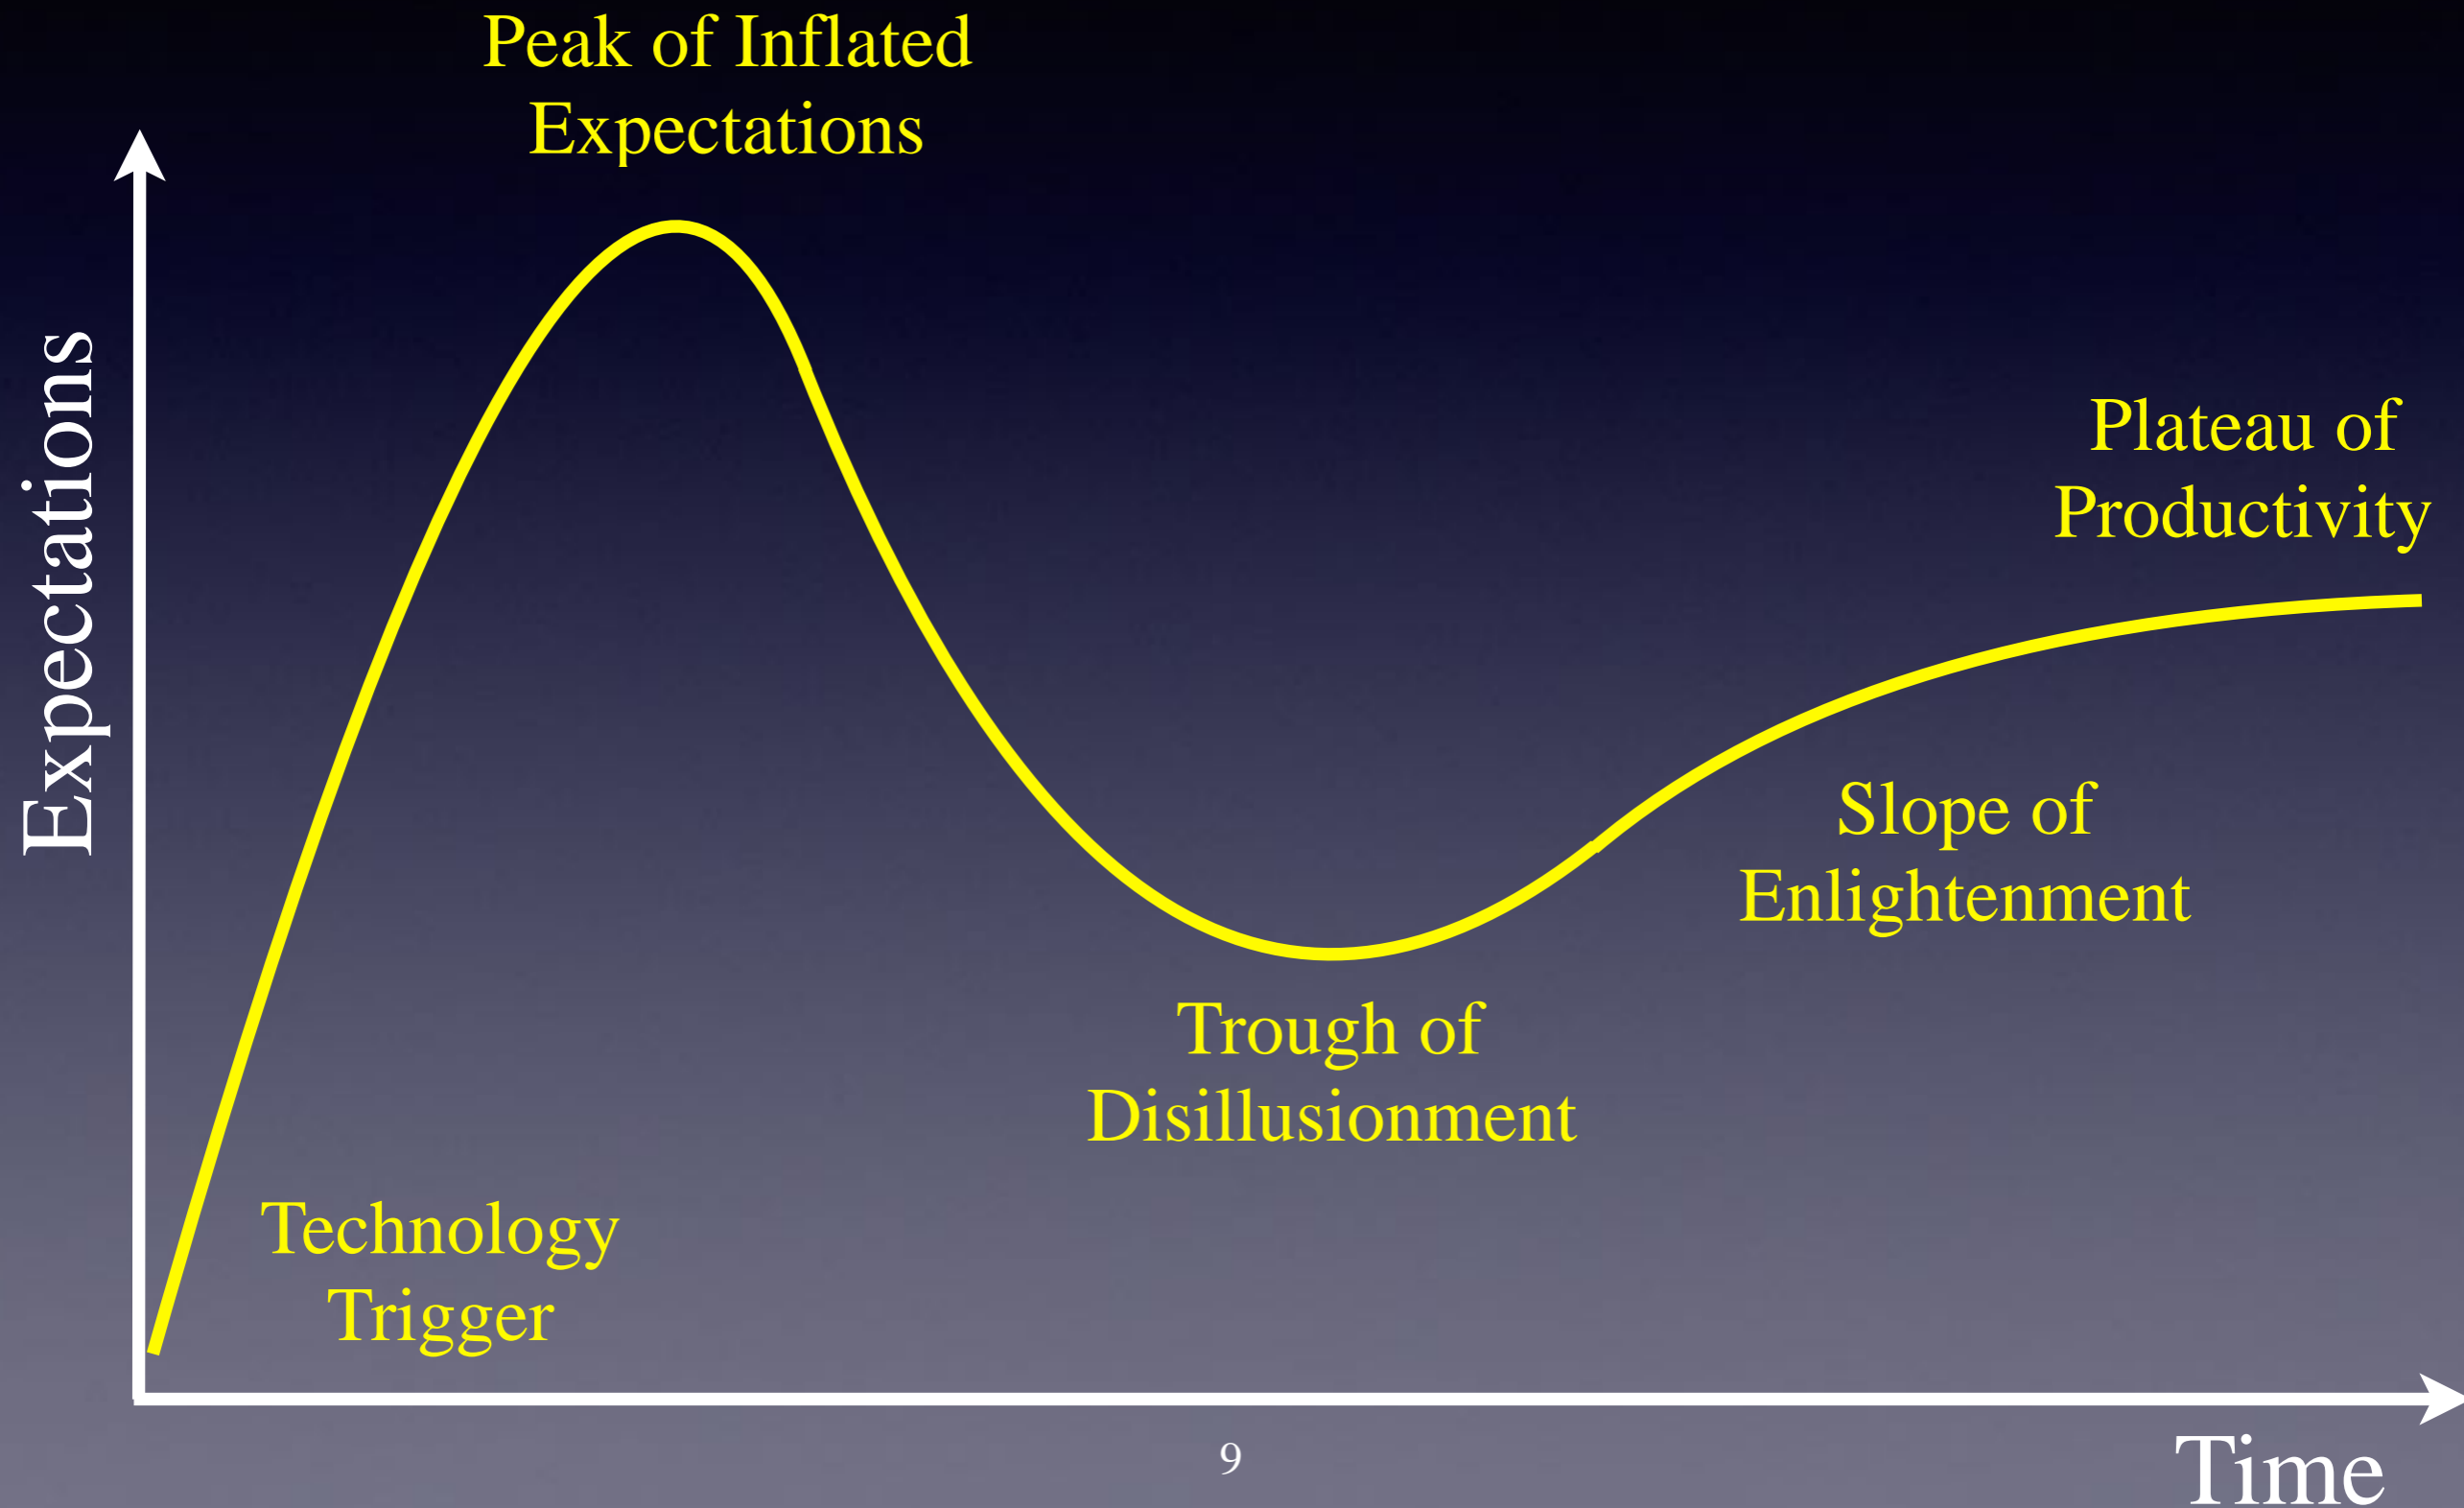

Short run < 5 years or so

Gartner Hype Cycle

Provide a graphic representation of how a technology will evolve over time.

Hype Cycles are used to determine the promise of an emerging technology.

Gartner Hype Cycle

Gartner Hype Cycle

Amara's Law

We tend to overestimate the effect of a technology in the short run and underestimate the effect in the long run.

Long run > 10 years or so

Clarke's Three Laws

1. When a distinguished but elderly scientist states that something is possible, he is almost certainly right. When he states that something is impossible, he is very probably wrong.
2. The only way of discovering the limits of the possible is to venture a little way past them into the impossible.
3. Any sufficiently advanced technology is indistinguishable from magic.

Many natural (and man made)
systems grow exponentially

$$y = \alpha 2^{t/\tau}$$

Many natural (and man made) systems grow exponentially

$$y = a 2^{t/\tau}$$

$$\log(y) = b + a t$$

Many natural (and man made) systems grow exponentially

$$y = a 2^{t/\tau}$$

$$\log(y) = b + a t$$

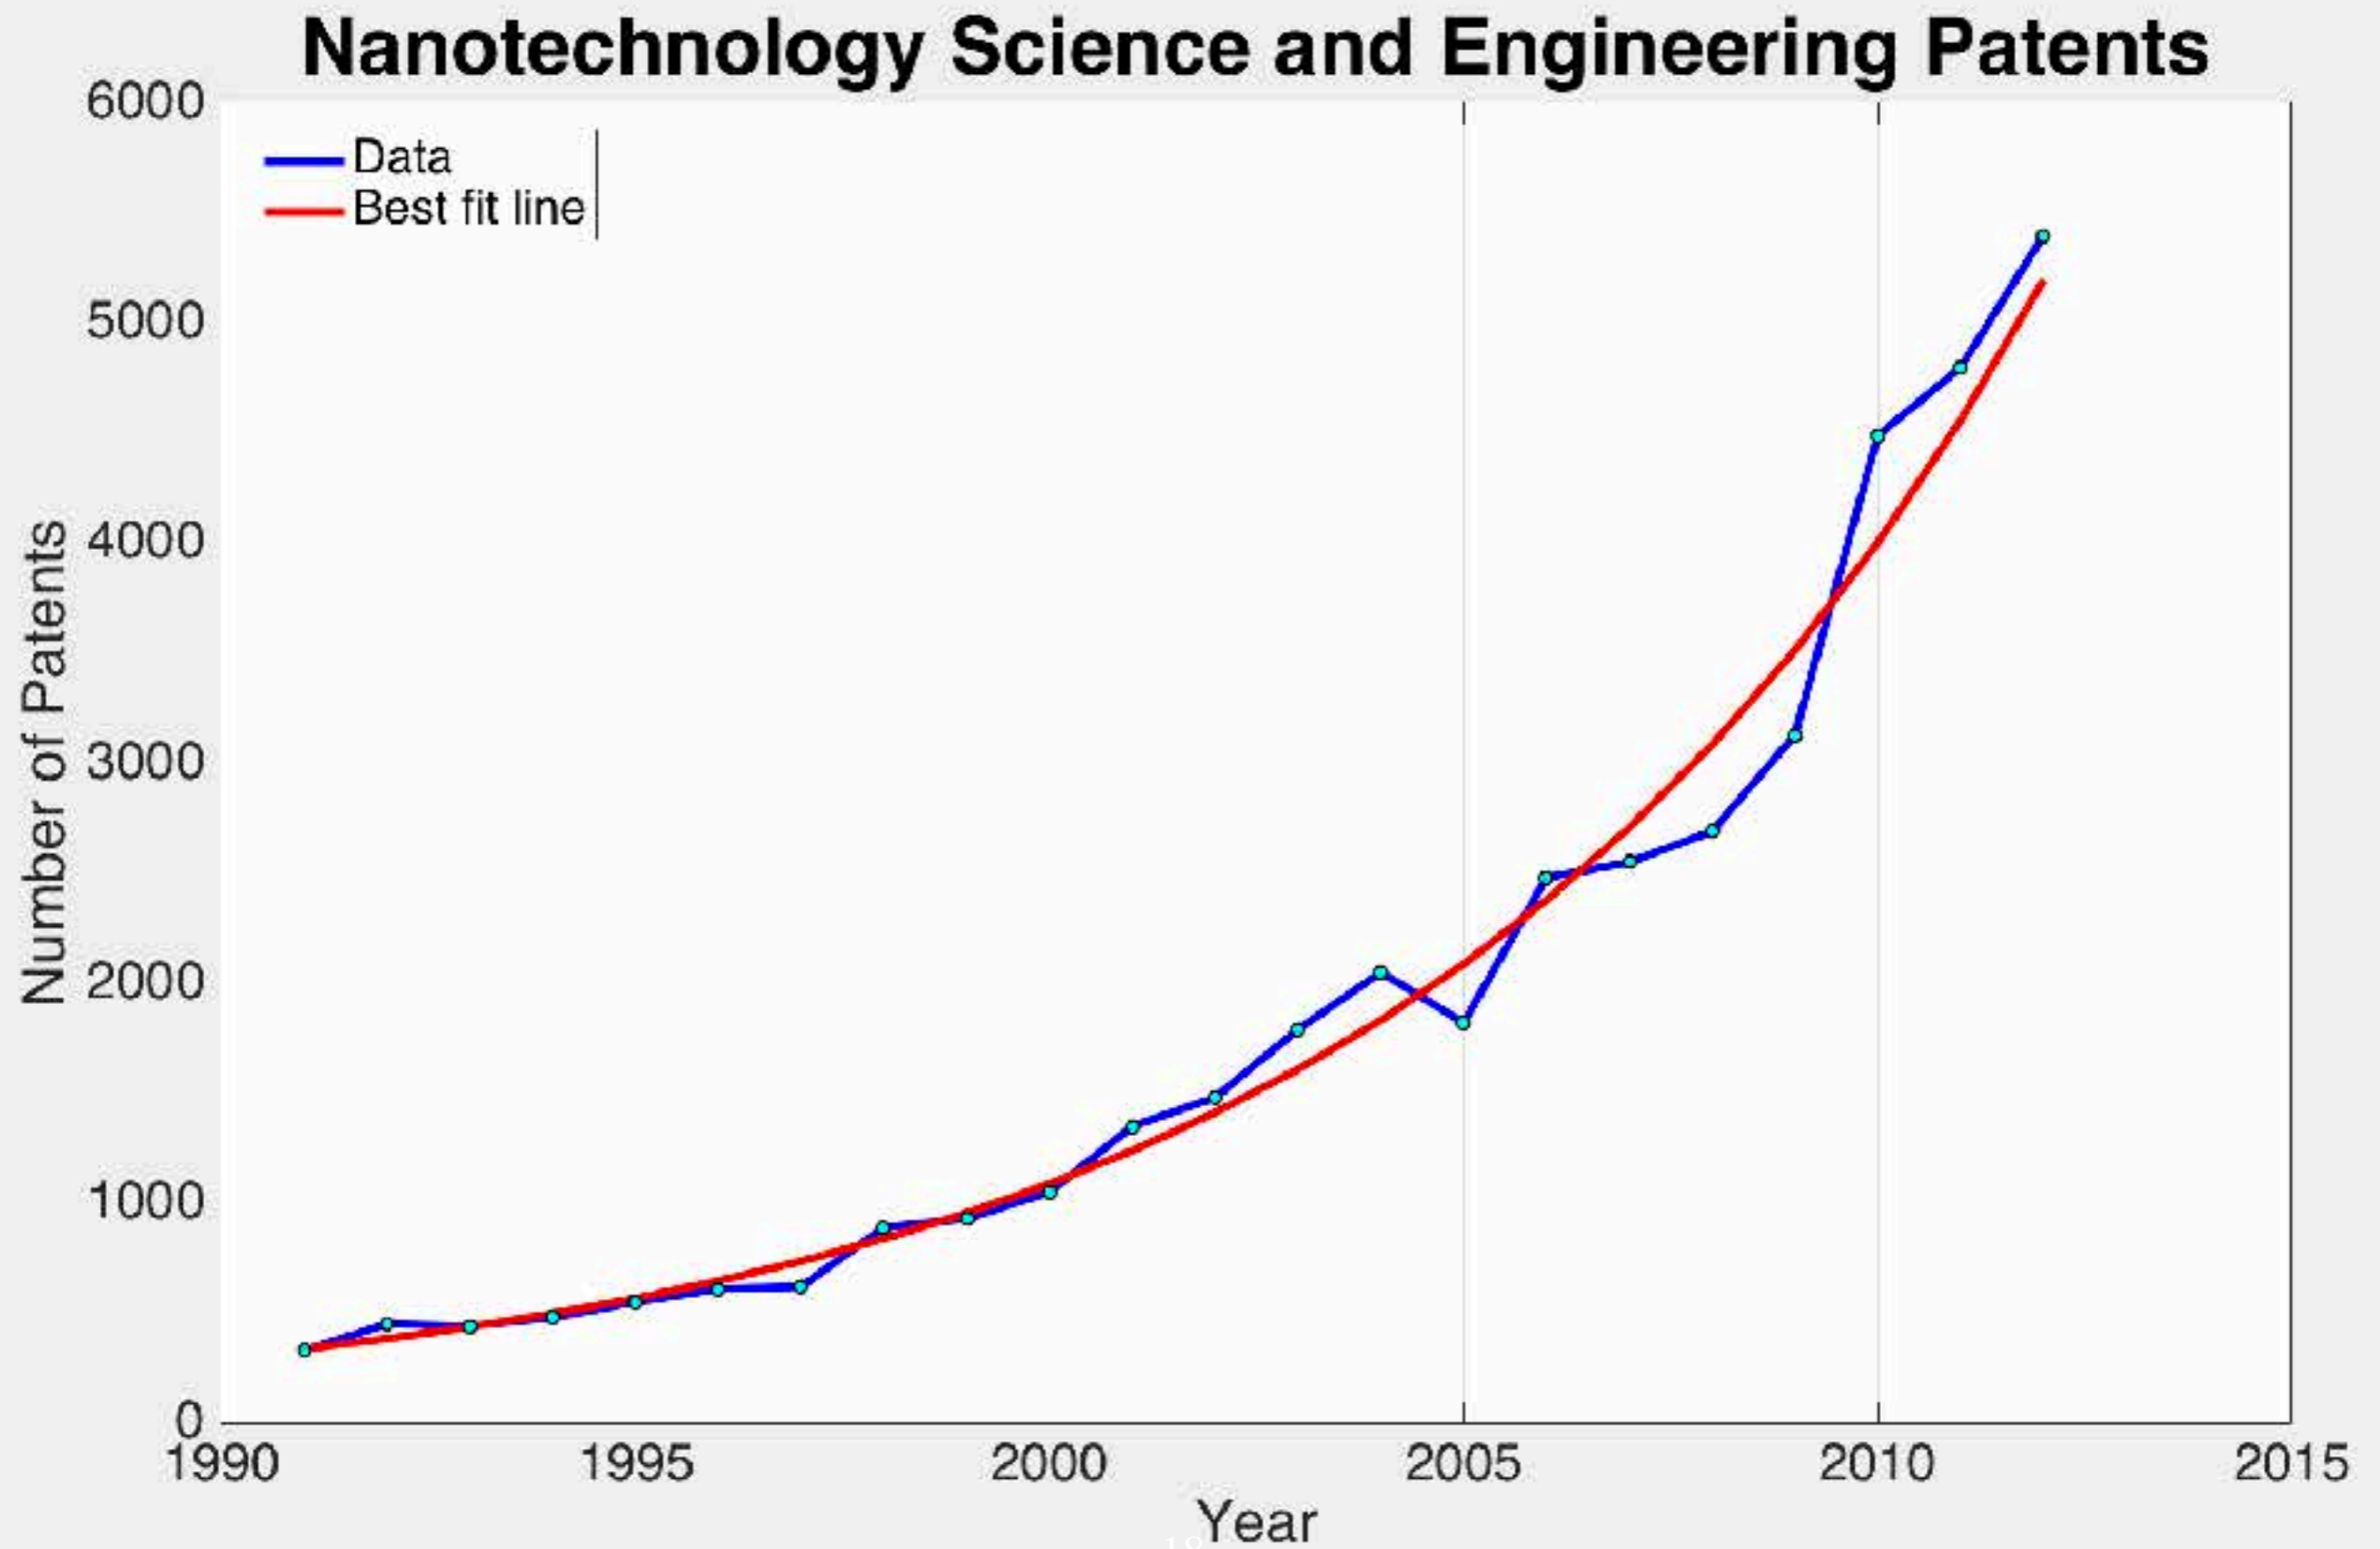

Nanotech Patents Issued by the US Patent Office

330 nano patents issued prior to 1991.

After the number doubled ~5 yrs.

$$y = 330 \times 2^{t/5}$$

Nano patents = 330 x 2^{Years/5}

$$\log(\text{Nano patents}) = \log(330) + 0.06 \text{ Years}$$

Nanotechnology Science and Engineering Patents

Moore's Law

Number of transistors per chip
doubles every year.

A related number is the number of
calculations/second per 2017 \$

$$y(t) = \alpha 2^{t/\tau} \quad \text{with} \quad \tau=1.3 \text{ yrs}$$

Outline

- Imagining the future
 - Short-term vs long-term
 - Exponential growth
 - **The Drivers**
- The technologies
 - Nanotechnology
 - Biotech
 - Artificial Intelligence
- Recent Developments
- Concluding Remarks

Imagining technologies of the future requires an examination of the drivers.

- Gaming
- Military
- Health care
- Elderly
- Environment
- Quality of life
- Safety

In 2010, gaming surpassed the military as the major driver for tech change

Volume is especially good at spurring the creation of new applications.

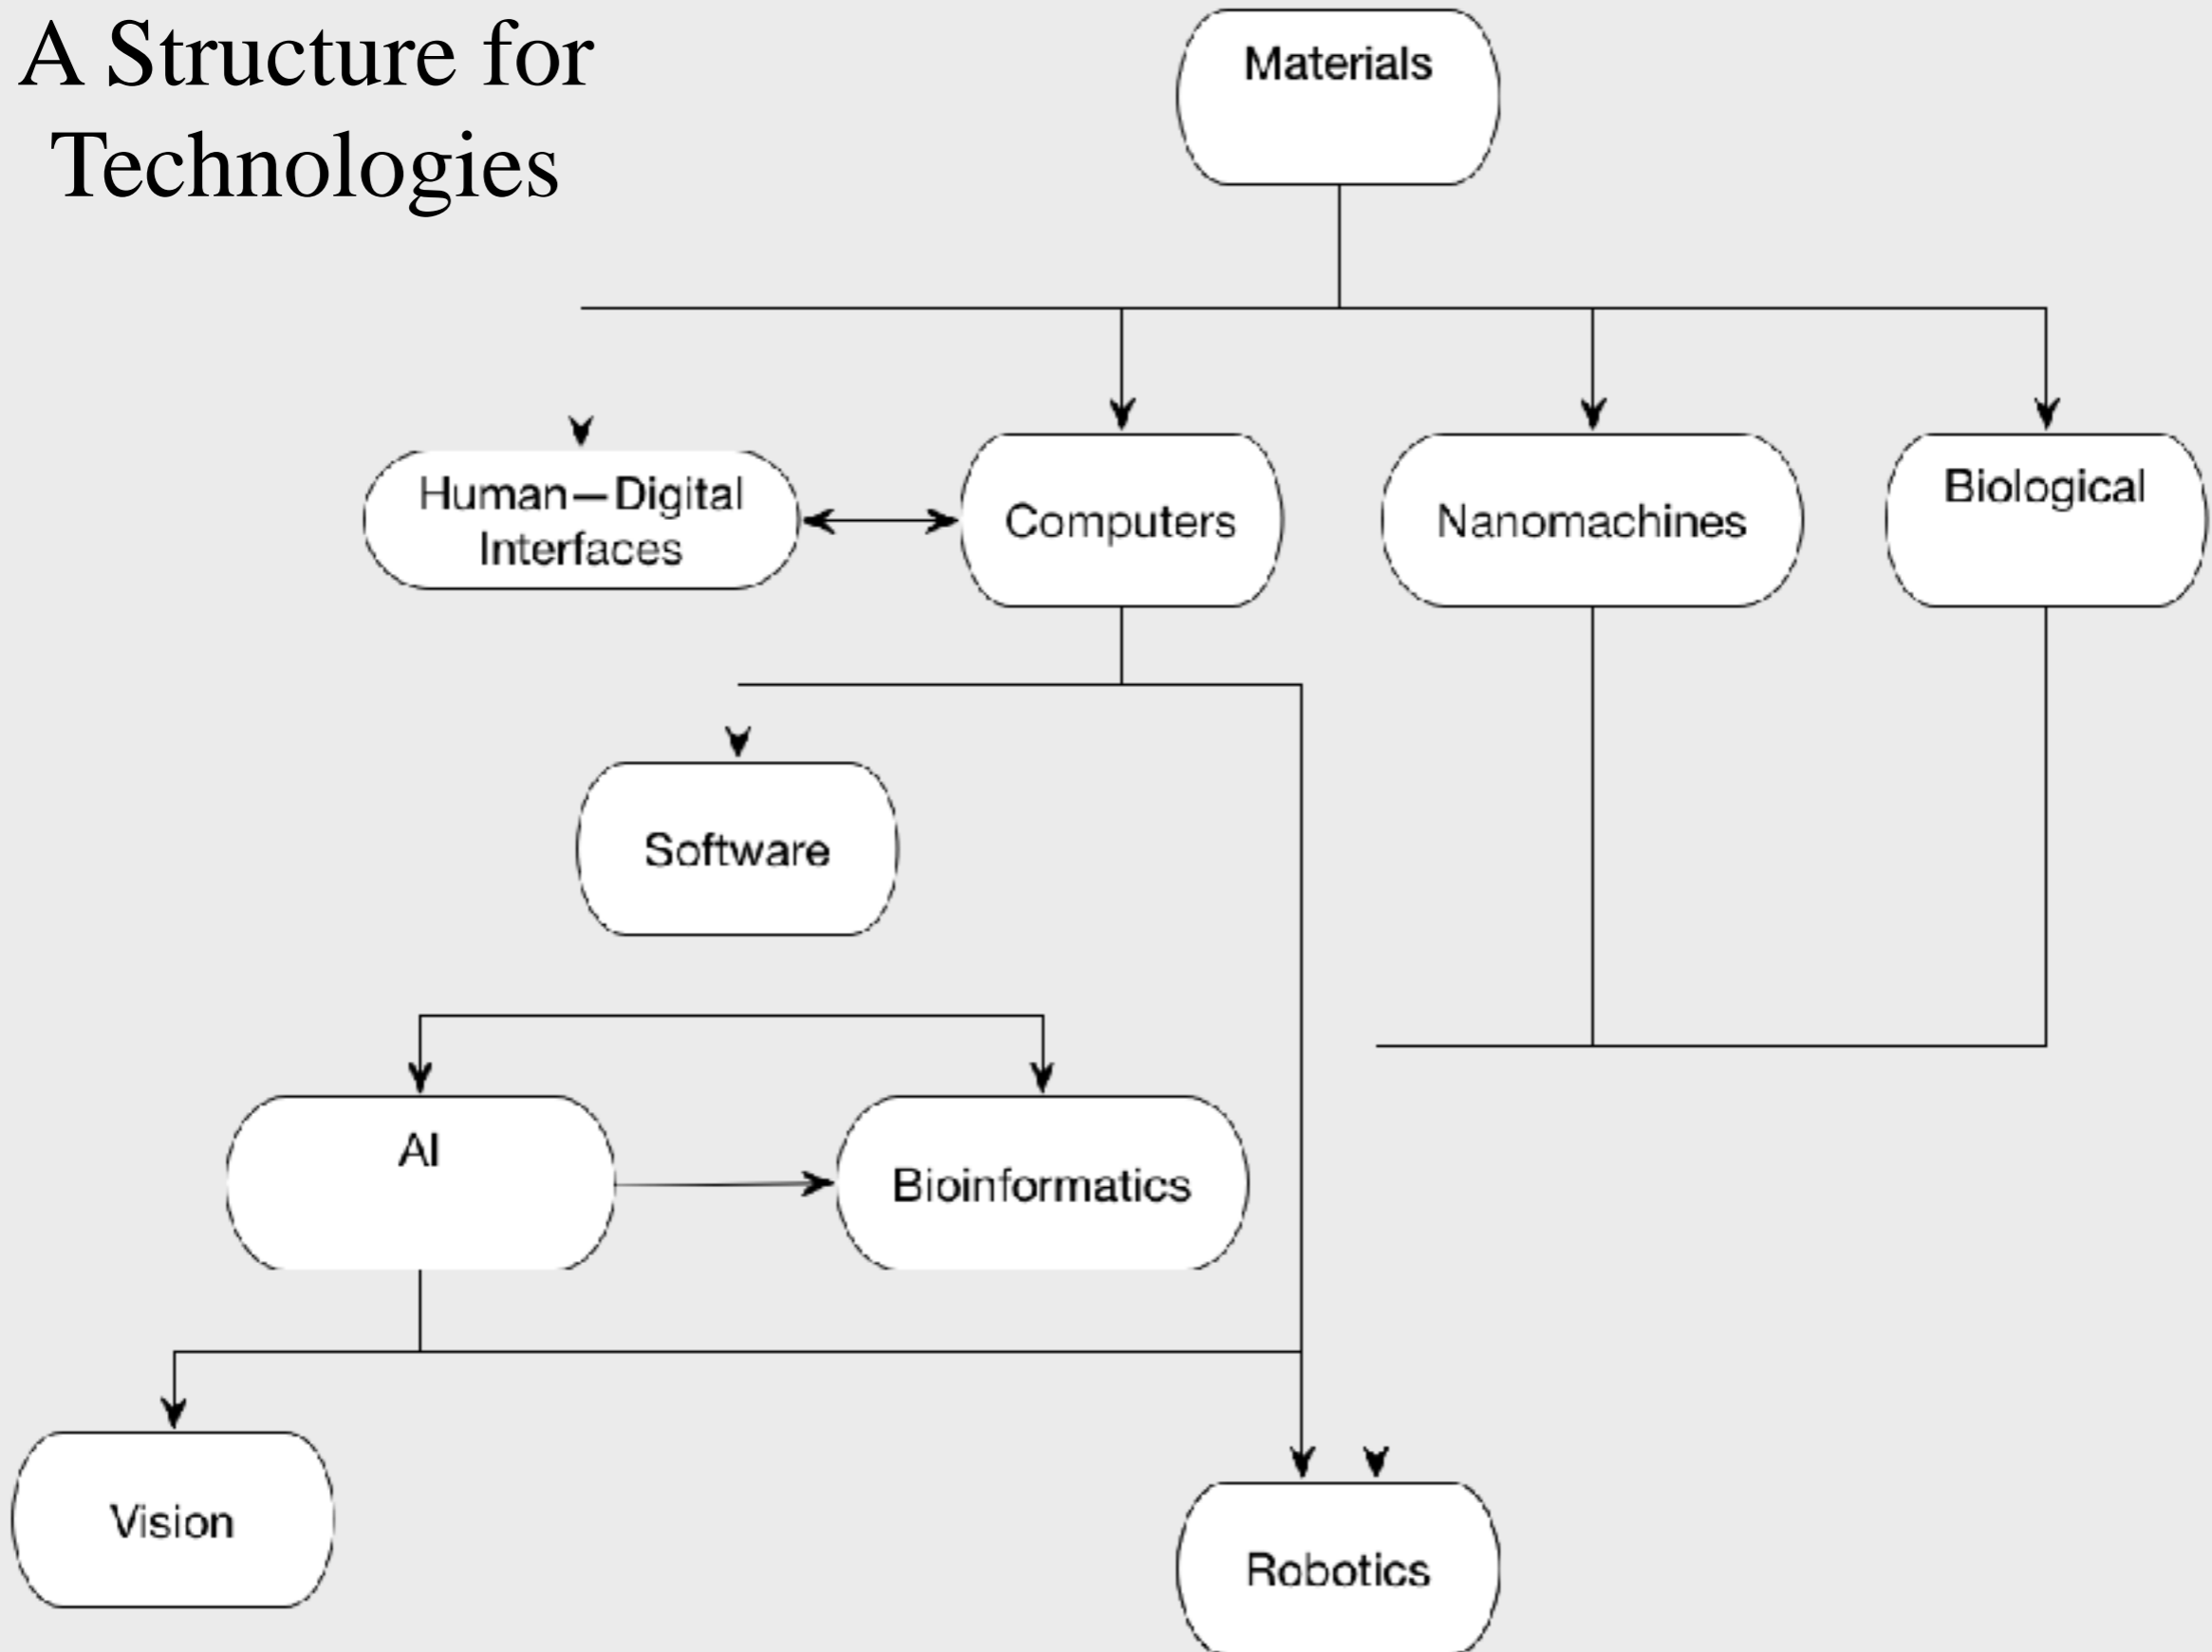

Some technologies attributed to/enhanced by gaming

- Color LCD displays
- Joy stick
- Graphics Processing Units (GPUs)
- **Virtual/augmented reality**

Example of the Growth of Artificial Intelligence Software

A constant refrain: computers are only as creative as the people who program them.

AlphaGo-Lee beat Lee Sedol in 4 of 5 games of Go in March 2016.

Over several months AlphaGo-Lee trained on thousands of amateur and professional games.

Example of the Growth of Artificial Intelligence Software

AlphaGo-Zero, the next gen Go playing game, beat AlphaGo-Lee in 100 of 100 games in October 2017.

And it did so with 1/10 processing power.

Given rules of Go, AlphaGo-Zero trained for ~3 days with **no** human input.

AlphaZero, most recent version, achieved superhuman skill in Go, **chess and other game types** knowing only their rules.

Think about it

In days, AlphaZero discovered new knowledge, developing unconventional strategies and creative new moves.

And it did so in a variety of games.

It accumulated 1000s of years of human knowledge in just a few days.

And ~3 years ago most experts predicted machines would not achieve superhuman capability in Go for >10 years

But Go and chess are games

Doesn't mean AI will function effectively in unstructured human environments.

Agreed - today, AI does not deal well in such environments.

But it will, the question is when?

And when it does, what are the consequences

Memristors power quick-learning neural network

Date: December 22, 2017

Source: University of Michigan

Summary: A new type of neural network made with memristors can dramatically improve the efficiency of teaching machines to think like humans. The network, called a reservoir computing system, can predict words before they are said during conversation, and help predict future outcomes

Single metalens focuses all colors of the rainbow in one point Lens opens new possibilities in virtual and augmented reality

Date: January 1, 2018

Source: Harvard John A. Paulson School of Engineering and Applied Sciences

Summary: Metalenses -- flat surfaces that use nanostructures to focus light -- promise to revolutionize optics by replacing the bulky, curved lenses currently used in optical devices with a simple, flat lens. These metalenses have remained limited in the spectrum of light they can focus until now. Researchers have developed the first single lens that can focus the entire visible spectrum of light -- in the same spot and in high resolution.

Now entering, lithium niobate valley

Researchers demonstrate high-quality optical microstructures using lithium niobate

Date: December 21, 2017

Source: Harvard John A. Paulson School of Engineering and Applied Sciences

Summary: Lithium niobate is already one of the most widely used optical materials, well-known for its electro-optic properties but it is notoriously difficult to fabricate high-quality devices on a small scale using lithium niobate, an obstacle that has so far ruled out practical integrated, on-chip applications. Now, researchers have developed a technique to fabricate high-performance optical microstructures using lithium niobate, opening the door to ultra-efficient integrated photonic circuits, quantum photonics, microwave-to-optical conversion, and more.
